

DeepTrack

Project Idea

We are developing DeepTrack to enable the tracking of underground mining machines. It ensures safety in the kilometer-long tunnels, as problems or discrepancies can be detected at an early stage. Another aspect is the optimization of these mining operations, as there is currently no other option for companies on the market.

Krische

Development of a mesh network

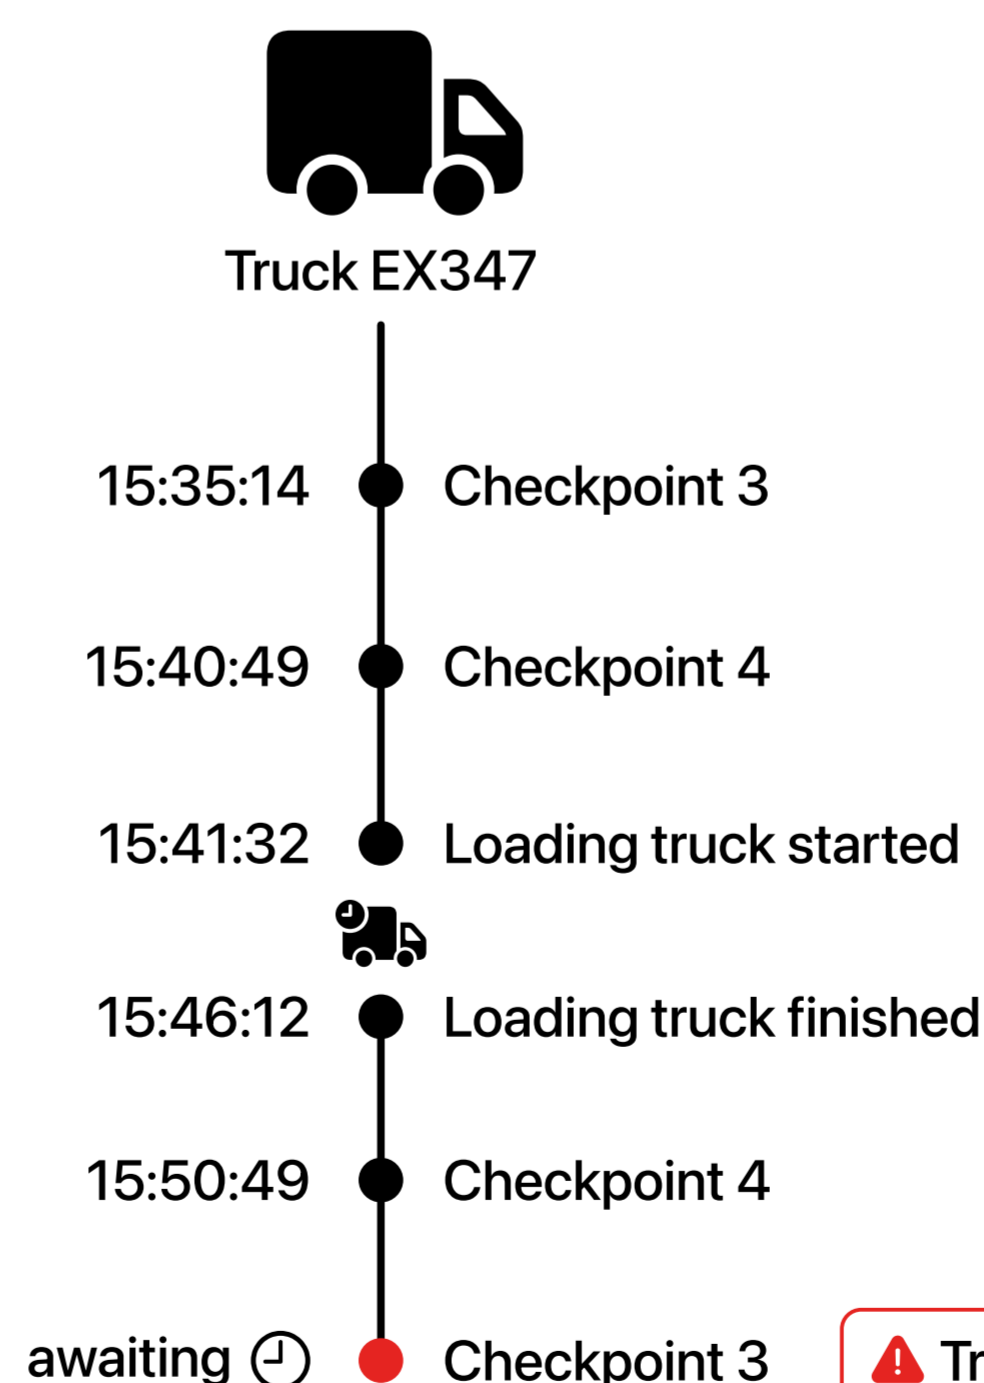

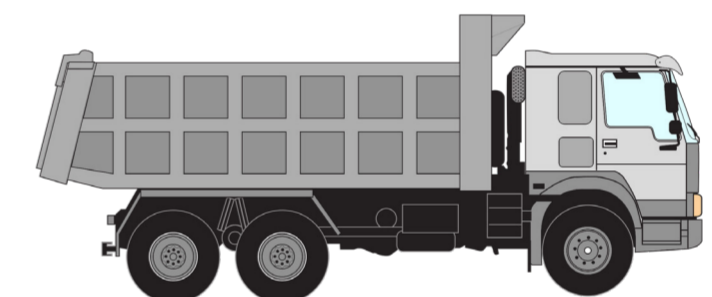

Tech-Stack

Lederer

Development of mobile devices for underground tunnels

Lost trucks or accidents can be detected at an early stage and the help chain can be initiated

⚠️ Truck should have arrived by now
